

RIJEČNI RAK / EUROPEAN CRAYFISH (*Astacus astacus*)

Nalazimo ga na ilovastom i šljunkovitom dnu hladnih jezera i vodotoka, najčešće uz obalu s vodenom vegetacijom. Riječni rak živi samo u čistim, nezagađenim vodama, pa je dobar pokazatelj "zdravlja" naših rijeka i jezera.

It is typically found on the muddy and gravelly bottom of cold lakes and watercourses, usually along the banks with aquatic vegetation. The river crayfish only lives in clean, unpolluted waters, making it a good indicator of the "health" of our rivers and lakes.
