

JADRANSKA JESETRA / ADRIATIC STURGEON (*Acipenser naccarii*)

Jesetre su jedne od najvećih vrsta riba, dugovječne su, sa specifičnim karakteristikama kao što je asimetrična repna peraja, izduženo i vretenasto tijelo s glatkom kožom i pet redova koštanih ploča. Svoj izgled nisu promijenile od doba dinosaura, a prvi fosilni zapisi jesetri datiraju iz kasne krede. Od ikre nekoliko vrsta jesetri proizvodi se najskuplji kavijar.

Sturgeons are one of the largest fish species, known for their longevity and distinctive characteristics such as an asymmetric tail fin, an elongated and spindle-shaped body with smooth skin, and five rows of bony plates. They have changed their appearance since the time of the dinosaurs, with the first fossil records of sturgeons dating back to the late Cretaceous period. From the roe of several sturgeon species, the most expensive caviar is produced.
